

USING THE ORGANIC RESPONSE SMARTPHONE APP

v1.0 January 2015

Accessing the Organic Response Remote App

The remote app is a simple, intuitive user interface for optimising an Organic Response lighting control system. An entire office of Organic Response Enabled luminaires can be optimised within minutes with the press of a few buttons.

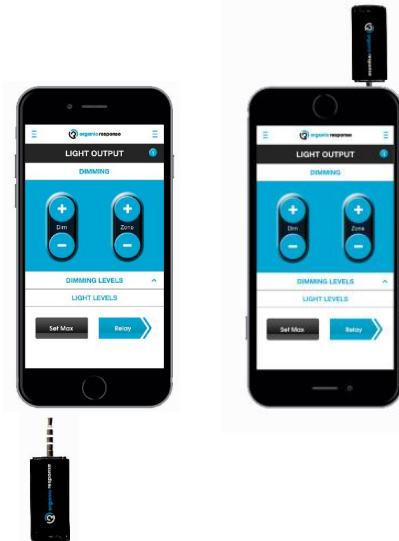

The app is free to download from the App Store or Google Play and contains contextual help as well as links to the User Guides. Immediately following download of the app, you will have access to some simple "User" level features. The app itself contains all the relevant information and contextual help that you need to utilize these simple features. The full range of **Optimisation** or **Configuration** features is accessible only by application through the drop down options in the **App Settings** menu of the remote app.

The app requires registration using your LinkedIn profile, and joining the Organic Response Forum LinkedIn Group. We encourage you to engage with this forum for advice, technical support and general discussion.

The Infrared Dongle

The remote app communicates with Organic Response Enabled luminaires using a special infrared dongle (shown opposite). The dongle should be inserted into the audio jack of your device. Always ensure that the dongle is pointing at the target luminaire's Sensor Node when you are issuing instructions from the app.

Infrared dongles can be ordered from us [here](#), or visit organicresponse.com.
